

In whom we trust

Creating Acceleration in Time

A word with the researchers:

Dear truth-seekers and scholars, you all definitely know Galileo and his story –the famous ancient Greek scientist– who informed everyone of the basic truths he had found out about the rotation of the planets. At that time, not only was he not given rewards, but also it took him to the gallows which finally made him regret what he had said earlier, because the criteria of judging people’s awareness in that time was based on their tribal beliefs and anything which was against it was called a blasphemy. However, rarely existed people among the authorities who were not blind to the truths and provided the space for the researchers for proper discussions.

In the present age, known as the age of communication, the exchange of information has exceedingly gone beyond the borders of the tribes. The satellite connections connect people of different countries and what seems to be important is the data which should be analyzed individually. No one is blamed for discovering new scientific truths and presenting it to people any longer and yet, there are those who carry the genes of their ancestors, believing that discovering truths should be exclusive. In reality, though, most of the mesmerizing inventions have occurred by the normal group of the society, those who do not even have academic education, but initiated the university laws. So, in the first place, it is important to admit that understanding truths requires no specific frame of mind, is not exclusive to anyone or anything, but that the ultimate truth of the world is related to each and every phenomenon; some groups see it, some understand it; those who see it try to make others understand it and those who perceive it, try to make everyone visualize it. Fortunately, we live in an era, where at least in the realm of science, there are intellectual measurement tools which have prioritized over the intellectual repressive tools and thus, a wide variety of people can express their scientific point of views. Now, if anyone claims that Earth is flat and is the center of the world, all the stars including the sun and the planets rotate around it, do you assume he will be punished? Or simply ignored as an illiterate person? Obviously, the type of behavior to others stems from the individuals’ awareness of the truths of the world. The more

they know about the facts, the more changed their behavior will become. In other words, the degree of freedom in a society regarding its individuals depends on their comprehension of the facts of the world.

If you visit the bookstores in your neighborhood, you will find numerous books with various titles, authored by famous or less-known writers. Many of these books have specific audience and many others are addressed to common people. If you have a specific point of view regarding the world, get it published in hard copy or share it online; you may find it that this way of thinking has been unique to you and that it has been only you who could observe certain facts. You may even be able to obliterate the dark spots of the current science.

The discovery of an insignificant fact from the rules of the world is like a small key to open a huge gate for human beings, specifically if that key is to open a door to human evolution.

Space, time, place, and material are four aspects of the world which shape the evolutionary process of the phenomena (including human beings) by their changes. If the rules and laws applying to them are discovered for us, we will be able to make alterations in these four dimensions and doing so, travel in time which is human being's everlasting desire. It is noteworthy that one of the most important elements which causes fundamental changes in these four dimensions is the information which is being processed in your brain every single second. In other words, the type of the information and how they are processed by human brain cells create waves that can directly influence space, time, place and material. This fact shows that the continuity of evolution in the universe is in direct relation with how human beings think. The book *Creating Acceleration in Time* contains engineered and useful data which provides the opportunities for you to process information in your brain, generate the equivalent electromagnetic waves and observe its effects in your path towards future.

You live as you think

Introduction:

We, human beings have many wishes in our heads and we would like to reach to them as soon as possible. Sometimes, we set our mental and emotional wishes as the goals of our lives; these goals are beautiful and sweet, but the paths we choose to get to them can be tough. To reach our goals, we are ready to embrace those difficulties and step in those paths. For instance, I can mention some jobs which are intolerable, but are necessary for having a war family with suitable degree of prosperity. That is why we are even pleased to admit the difficulties of the job. In fact, that is why we are ready to put the fullest level of our physical and mental capabilities into work to make money.

Neither of us likes these excruciating paths and it is only the result that makes us go through the hardships. Many a times, we have marked a specific day on our calendars as the magic day, waiting for something special to happen. We would like to pass the days as soon as possible to get to that special day and embrace happiness.

Moving hastily on the path to achieving the desires and pausing for long in time with wishes is a precious thought which has occupied intellectuals' thoughts from old ages. Now, it is being pursued as a research topic by scientists, a topic which is trying to figure out how time is compressed.

Imagine that you are able to reduce the space of reaching your goals and shortening long paths by accessing the knowledge of time compression. In other words, you can achieve your desires as soon as possible. Probably, this is the motivation behind scientists' efforts to build a time machine.

Studying the evolutionary history of science, we understand that each new theory is based on data process and data compression and the same process shapes the path of the future sciences. Accordingly, data compression, and their coding is one of the most crucial responsibilities of the scientists. For instance ordinal numbers, like number 1000 which presents one thousand numbers below itself. If complementary numbers were not defined, we would have had written one thousand ones on the paper to present 1000 which would have been boring to death for the

audience or he/she wouldn't have grasped the next messages. So, when we write 2 on a text, we understand that two ones have been compressed, or when we see 1000, we perceive that it is the compression of one thousand ones. This compression helps us function faster in solving the equations and reach more thorough results.

The process of data compression witnesses a mixture of different sciences in its paths; for example, the science of biochemistry which is a combination of biology and chemistry or bioelectronics which is an amalgamation of biology and electronics. Of course, this process is not limited to certain fields of studies and in a near future, we will observe a combination of different other fields of studies with each other, biophysics and biomechanics to name a few. Both of these mentioned fields can be classified as biotechnology groups, with a subcategory of physics or mechanics or, etc. We can even think beyond these groups, for a mixture of biotechnology and geography and history is also possible, since the scientists have discovered that historical and geographical changes have direct influence upon human generations. In fact, with highlighting the science of biology and connecting it to other sciences such as physics and chemistry, we can get closer to perceiving the relation between the material and the gene as the main piece of the puzzle of evolution. It has always been a question how a phenomenon called gene has been shaped on Earth after the evolution of the material in the universe and then has developed in its plant, animal, and human dimensions.

In the universe, especially in the planet Earth, all the phenomena follow the same ecosystem and the pattern of growth and evolution of each phenomenon depends on the proper and logical relation with other phenomena which exist in and form the whole evolutionary chain of being. With the passing of time and with the increase of human consciousness from the universal truths, this homogeneity becomes even more apparent.

If you have little knowledge of fields such as genetics, you will know that genes are the information structure of the cells of the body of genetic organisms and each gene carries its own unique information. Genes are highly influenced by the environment they are placed in, and reflect their environmental conditions in their behavior. Therefore, the concentration of a large number of genes in the cellular structure of a living creature can cause unpredictable behaviors in the face of unforeseen situations, which is called cellular behavior in medical terms. In this

regard, genetic scientists have been able to discover genes in the body which are capable of conveying experiences and work skills from generation to the next. This fact shows that in the future, the science of biotechnology will be able to produce many of the concepts and scientific formulated equations as well as work skills in the form of equivalent genes and transfer it to the body of different people. It might even be possible to transfer the genes that are adapted to certain climates to the body of people to make them suitable for living in certain circumstances. That said, the science of hybrid genetics has far more uses than the elementary science and its structural compounds in the initial forms of the materials. Currently, the science of hybrid genetics is called genetic engineering.

The nature of the universe, too, constantly, does the process of data compression whose result is the formation of newer and more thorough forms of phenomenon in nature. Now, human being is considered as the most complex form of natural achievement and the result of procession and compression of genetic data in nature.

The process of the compression of evolutionary achievements has existed in the universe since the beginning of the creation. Each stage gives birth to the next which is more thorough, more complex and better.

Here it shall be mentioned that the presence of active mechanisms in the nature help us write encyclopedias (by discovering and studying them) which is called science in general. In other words, science is an amalgamation of the results of different sciences and as the process of formation of evolutionary mechanisms in nature is the result of establishing a logical and regular relationship between phenomena, so to reach a final truth in the evolution of science, an orderly relationship between the data from different sciences should be defined. Today, human sciences, like separate elements grow individually and in many cases surpass each other and have an abnormal, inconsistent growth which will have consequences for the natural mechanisms and finally ruins planet Earth.

These days most of people know that using the technologically processed products harms both their mental and physical health. Accordingly, this shows a lack of proper connection between different fields of studies and biology. In fact, knowing the accurate knowledge of evolutionary mechanisms of natural phenomena

and how they connect to each other provides us the chance to organize our efforts in data compression in efforts to reach a unified truth.

For instance, what we call nuclear velocity of materials in physics is called mutation of a gene in the cell in genetic engineering. What we should be looking for is the relationship between these two processes, namely nuclear velocity of materials and mutation of a gene in the cell which work together in the nature, while human sciences considers them separate. In other words, we need to first find the cause of the relationship between the element and the gene, and then look for the forces that simultaneously cause velocity of elements in materials and genetic mutations in cells. In fact, this accelerating force is common between genes and elements which shape the topic of evolution in nature. Obviously, the creation of one-dimensional accelerations in material particles without the presence of the genes and the creation of genetic mutation without the presence of material particles or without considering the natural relationship between these two products, the evolutionary path will not be drawn perfectly.

The day human being began to study the phenomena around him, he first encountered with material and its constituent elements in nature. But on planet Earth, only elements were not formative parts of nature, but genetic phenomena such as plants, animals and humans too existed which had entered life one after another. What matter is the missing link between the element and the creation of the genes. Of course we all know that the birth of the first gene on earth belongs to a plant which emerged from the constituent elements of the material and in the rest of its growth, formed the plant nature on earth. Following that, animal genes appeared and after the evolution of successive generations of animal genes, human gene showed up. If we assume that human beings are that last evolutionary phenomena in the universe, we are obviously wrong and we definitely need to accept that the universe has plans for phenomena which are rather more efficient than human beings.

In the course of the evolution, human scientific history has not been initiated from human beings, but that the path of creation and evolution of human sciences first started with materials and its constitutive elements, continued with knowing the nature of plants and then sciences in the study of animals and later on human studies occurred one by one, each leading to their own specific technologies.

Today, human technologies grow and expand in two major and separate fields. First technology is in the field of material and its constitutive elements which is called industrial technology and the second technology is in the field of genetic compounds which is called biotechnology, and includes genetic creatures such as plants, animals and humans. However, the technical knowledge of these technologies are not steady nor are they permanent and they change with the increase of human consciousness of the facts of the universe and become more complete.

One-dimensional growth of the industrial technology in the field of elemental compounds and the creation of inconsistent phenomena with the biological structure of the planet Earth has caused a dissociation of the intra-phenomena evolutionary relation one of whose results is the destruction of nature, imbalance, and formation of defective genetic structures in human generations.

Obviously, the decent connection point between these two technologies (the industrial technology and biotechnology) completes only when human beings can find the missing link in connecting the genes to the primary elements of the materials and then to decide carefully how mutation leaps in genetic structures occur. It is only then that the rational growth path of destructive technologies can be corrected and unless the mystery is not solved, there will be a day when human being tolls the death bell for himself and other genetic creatures on earth with the growth of one-sided technologies in industry and business. To avoid this fiasco, it is necessary to define common links between different sciences and related technologies. To do so requires the close contact of material engineering and genetic engineering.

Obviously, there are pervasive relations between materials and the genes which cause the orderly movement of phenomena and their growth and evolution in the nature and universe. The discovery of these relationships leads us to make correct and logical connections with all phenomena. More importantly, human body is a common product of material and gene and we have to provide the elements needed for the normal growth of our body cells on a daily basis. Therefore, engineers who attempt to create a time machine need to know that their device should not only be able to generate nuclear velocity of materials, but also it should be able to make genetic mutations as well because human beings need element acceleration and genetic mutation both, simultaneously to create velocity. Accordingly, building a rocket faster than the speed of light and having a human being seated in it, only the

structural materials of the body are accelerated and transformed into energy. In order to form the combined mutations of the material and genes which are the basis of human evolution, we should look for more thorough facts in the initial forms of material.

Currently, the discovered facts in various scientific domains reveal that all of the creatures and the phenomena in the universe, whether elemental or genetic-based, have a hidden relationship with each other, in addition to apparent environmental relations, which tie their evolutionary processes to each other. This hidden relation lays the groundwork for the formation of evolutionary mutations and the emergence of new phenomena in nature. In other words, what we observe in the apparent movement of the phenomena is the result of their latent interaction with each other.

Simply put, there is an invisible force between the particles and around the phenomena which is the basis of movement in the universe. Therefore, it can be said that all the phenomena in the universe, from a stone to a living creature like human being, have a invisible energy in addition to their obvious one, which we call invisible energy for now.

It was long assumed that this invisible energy around the phenomena equated their structural mass. Thinking so, one should have considered a direct relationship between the amount of hidden relationship in a phenomenon and its mass. But when it came to the calculations of the apparent energy of the phenomena based on their mass and their comparison with the amount of the invisible energy around them, the results showed that in many cases there were no balances between the apparent and invisible energies and that the degree of the hidden energy was rather more. They, thus, concluded that the invisible energy around the phenomena depends on another substance which had yet been ignored; we will call it invisible substance for now. It can be said that the mass of the visible substances has a visible energy and the mass of the invisible substance has an invisible energy.

According to the latest calculations, it has been determined that the visible energy share of the universe is 25% and the invisible energy share around the phenomena is 75%. This proportion is not steady and can change any minute in favor of the invisible energy. In other words, over time, the materials and the visible energy of the universe decrease in amount and the same is added to the invisible amount of

the universe. Based on this result, the scientists have declared that currently the balance between visible materials and energy and invisible materials and energy is lost and the invisible one weighs more. This causes modifications in the dimensions of space, time, place, and material in the visible universe. In fact, a process of transferring material and energy from visible to invisible is occurring the result of which is the absorption and the transfer of visible mass from visible universe to the invisible space. Based on this study, the more we go back, the more we material and energy we have in the visible universe and the less we have in the invisible universe, but the more we head towards the future, the process is reversed; meaning that the materials and the invisible energy will be increased while the material and the visible energy will be less and less. That is why many physicists believe that one day all the mass of the materials and the visible energy in the universe will be absorbed in the invisible space and the visible world will shrink and become as small as a star stuck inside a black hole, eventually fading away. In that case the visible material world will decay into darkness and the material and the invisible energy will encompass all the being. In a general sense, this is the process of compressing structural information in the world of creation.

As the combination of visible materials cause a change of visible energy in nature, the amalgamation of invisible materials, too, cause the change in invisible energy.

The combination of invisible materials, just like the combination of visible ones, needs to specific laboratories or workshops. The stimulation mechanism and the combination of invisible materials around the phenomena occur through the collision of electromagnetic waves with these materials. As you know, all natural phenomena, from a stone to a human being, produce and emit electromagnetic waves based on their intra-structural activities. The emitted waves from a stone are generated by the constitutive elements of that stone and in human beings, the production and emission of electromagnetic waves occurs through the process of information in the brain. In other words, human brain is the most crucial organ in generating electromagnetic waves which simultaneously processes information in its cells to produce equivalent electromagnetic waves and propagate in the surrounding space. These waves are capable of influencing the invisible materials and stimulating them in the invisible space which accordingly, influences the visible universe. The scientist call these effects the “metaphysical effects” today.

With this mechanism, any individual can process the information in his brain and transmit electromagnetic waves by which invisible materials are impregnated. Next, they will mix with each other and create effects that are parallel with the processed data. These invisible influences will become visible in the body of the individual and his/her environment. This process is in fact the missing link between the phenomena which is the cause of the formation of evolutionary processes in the universe. In fact, this is the invisible factor that bonds the behavior of an element to the behavior of a gene.

The acceleration scheme in time is designed based on the processing of combined data and the accurate processing of these information causes the generation of electromagnetic waves by the brain cells and the appearance of metaphysical effects by the invisible impregnated materials. In fact, we are capable of emitting electromagnetic waves by processing information which impregnates invisible materials in the visible world around and causes drastic changes in our move towards future. These changes are called metaphysical changes.

At present, all human beings, by processing information about their personal desires, produce effects that cause them to influence and attract the factors that make their dreams come true. To be honest, the events and happenings of our lives are predestined scenarios which we create, willingly or unwillingly, through sending electromagnetic waves. Many of the scientists call this mechanism the thought technology and since the technology of thought needs a programmed plan, we call this field of study “thought engineering” or “engineering of invisible materials.”

Based on the engineering of invisible materials, the more complete and accurate the data in an individual’s brain is, the faster the scenario regarding his success in achieving his goals will be. For instance, when you design an automobile, the more information you have from the function of the car, the more thorough your design will be. Accordingly, you will reach a more desirable result in practice as well. The less our engineering information about the car is, the weaker the design and building of the car would be. Accordingly, the emission of engineered electromagnetic waves by us create better results and in the same way, the generation of incomplete and unharmonious electromagnetic waves will result in unwanted outcomes.

You need to bear in mind that the engineering of information should occur in the path of natural evolution. Now, we would like to use engineering of invisible materials to formulate the acceleration of time with the given information and based on the rules of the natural evolution. So, a specific attention is paid to each and every sentence that is proposed in this book so that the generated electromagnetic waves by your brain cells and the effects surrounding your body reveal their effects in your life. In this process, any conclusion of the information in the mind contains one stage of the compression of the time which propels you in the path of normal timing. Therefore, the speed of your propulsion in the path of natural evolution depends on your absorption of data and your quality of processing them.

You can see a series of complementary questions here: Is there an end to this compression? If yes, at the end of it, what level of existential evolution will human being reach? In general, what fate will succeeding in this process bring for a human being?

Definitely you can find the practical answers to these questions in the practical equations and formulations of this book, but it can briefly be said that the result of the procession and the compression of data along in line with the natural evolution causes an increase in the invisible energy around our bodies. The supernatural increase of invisible energy around our bodies distort the balance of visible energy and invisible energy based on our bodies. This growing process condenses and compresses the structures of the body at each moment and the harmony of the structures of our bodies with these pressures cause a change from a human to a superman where human being is moved from the natural dimensions of space, time, place and material to the super natural dimensions of space, time, place and material and starts a life with these new rules.

Formation of such a process during one's lifetime obliterates the phenomenon of the natural death and connects the rests of the natural life to the supernatural one. This process is called a change of nature from visible to invisible which is only possible through creating acceleration in time.
